SUMMARY GENERATION USE CASES

The Summary Generation component is a sub-module of the AI Analysis system responsible for consolidating repository information and providing actionable insights in a concise, user-friendly format. The use case diagram illustrates how this component interacts with other system elements, including the backend, API, and AI Analysis core functions.

The Summary Generation component enables the AI Analysis system to produce comprehensive reports and insights. It calls the fetch DORA metrics function, which typically interacts with the API to retrieve repository data via the appropriate backend routes. Within this component, the analyze repository function evaluates repository content, the generate insight function interprets findings and identifies trends, and the download report function allows users to export the summarized information.
